The following information was issued as a Company announcement in London, England and is furnished pursuant to General Instruction B to the General Instructions to Form 6-K:

Market risk

Market risk arises from changes in interest rates, foreign currency, credit spread, equity prices and risk related factors such as market volatilities. The Group manages market risk centrally within its trading and non-trading portfolios through a comprehensive market risk management framework. This framework includes limits based on, but not limited to, value-at-risk (VaR), scenario analyses, position and sensitivity analyses.

At the Group level, the risk appetite is expressed in the form of a combination of VaR, sensitivity and scenario limits. VaR is a technique that produces estimates of the potential change in the market value of a portfolio over a specified time horizon at given confidence levels. For internal risk management purposes, the Group's VaR assumes a time horizon of one trading day and a confidence level of 99%. The Group's VaR model is based on a historical simulation model, utilising data from the previous two years trading results.

The VaR disclosure is broken down into trading and non-trading. Trading VaR relates to the main trading activities of the Group and non-trading VaR reflects reclassified assets, money market business and the management of internal funds flow within the Group's businesses.

As part of the ongoing review and analysis of the suitability of the Group's VaR model, a methodology enhancement to the ABS VaR was approved and incorporated into the Group's regulatory model in 2010. The credit crisis in 2007-2009 caused large price changes for some structured bonds and the spread based approach to calculating VaR for these instruments started to give inaccurate risk levels, particularly for bonds trading at a significant discount to par. The methodology enhancement harmonised the VaR approach in the Group's US and European businesses by replacing the absolute spread based approach with a more reliable and granular relative price based mapping scheme. The enhancement better reflects the risk in the context of position changes, downgrades and vintages as well as improving the differentiation between prime, Alt-A and sub-prime exposures.

All VaR models have limitations, which include:

- · Historical simulation VaR may not provide the best estimate of future market movements. It can only provide a prediction of the future based on events that occurred in the time series horizon therefore, events more severe than those in the historical data series cannot be predicted;
- · VaR that uses a 99% confidence level does not reflect the extent of potential losses beyond that percentile;
- · VaR that uses a one day time horizon will not fully capture the profit and loss implications of positions that cannot be liquidated or hedged within one day; and
- The Group computes the VaR of trading portfolios at the close of business. Positions may change substantially during the course of the trading day and intra-day profits and losses will be incurred.

These limitations mean that the Group cannot guarantee that profits or losses will not exceed the VaR.

Market risk (continued)

The following tables analyse the VaR for the Group's trading and non-trading portfolios excluding Structured Credit Portfolios (SCP) for the last four quarters, segregated by type of market risk exposure, and between Core, Non-Core, Counterparty Exposure Management (CEM) and Core excluding CEM.

CEM	84.2	78.4	96.5	72.0	85.9	78.6	104.9	71.5	79.5	73.5	108.7	
Non-Core	135.7	101.8	169.4	97.5	96.1	104.9	108.1	82.7	84.6	87.1	98.8	

Key points

The average and maximum credit spread and Non-Core VaR increased overall in Q3 2010 compared with Q2 2010 due to the Group's exit from some highly structured Non-Core positions which, due to their complexity and layering, required unwinding with different counterparties over different periods. The timing of the unwind led to an increased VaR for a limited time during the quarter. The exit was completed in October 2010.

The Core VaR remained within the expected range reflecting the day-to-day trading activities.

RBS Group - Q3 2010 Results

Market risk (continued)

			tember 201	.0			June 2010	31 March 2010				
		Period				Period			Period

Core	49.6	46.0	58.2	42.1	50.7	31.9	77.8	30.6	93.2	76.2	145.7	
Non-Core	80.4	76.6	85.3	76.2	84.9	85.5	94.7	70.2	76.2	72.5	79.6	

Key point

VaR is not always the most appropriate measure of risk for assets in the non-trading book, particularly for those in Non-Core which will diminish over time as the asset inventory is sold down. To better represent the risk of the non-traded portfolios, the table above analyses the VaR for the non-trading portfolios but excludes SCP in Non-Core. These assets are shown separately on a drawn notional and fair value basis by maturity profile and asset class and are managed on both an asset and RWA basis. This portfolio continues to be rundown as part of the Group's Non-Core disposal strategy.

RBS Group - Q3 2010 Results

[•] The overall reduction in total VaR was primarily driven by reduced credit spread risk during Q3 2010 as a result of disposals of some uninsured super senior tranches of CDOs and AFS assets.
