## Media Release

# **Following Syngenta-initiated investigation of unintended corn release, EPA and USDA conclude existing food safety clearance applies, no human health or environmental concerns**

**Washington, DC (USA), 21 March 2005**

During advanced testing, Syngenta recently discovered an unintended event, Bt10, in a small number of its corn breeding lines used primarily for pre-commercial development. The Bt protein produced by these lines is identical to that produced by the commercialized, fully approved Bt11 varieties. Therefore, there is no change to the food, health and environmental profile of the corn.

Upon this discovery, Syngenta immediately informed the EPA, FDA and USDA. These regulatory agencies have also confirmed the food, feed and environmental safety of Bt10. All current plantings and seed stock containing this material have been identified and destroyed or otherwise contained.

Syngenta's insect resistant European corn borer product Bt11 was approved for cultivation and food use in 1996 in the United States and for food and feed use in Japan in 1996 and the EU in 1998.
